

KEYLIGHT

 **Caution:**

Folded or twisted(wrong)

Bend (Right)

- Never connect the 12-volt or 24-volt strip directly to 220 volts. This will cause immediate and irreversible damage to the strip.
- If cabling has been installed on both sides of the LED strip, please note the following: When connecting one side to the driver, make sure that the other side is covered to prevent short circuits. Short-circuiting causes immediate damage to the strip and can therefore no longer be used.
- The LED strip is an electrostatic and sensitive product. Use anti-static gloves at all times when handling the strip.
